(57) Abstract: The instant invention pertains to a thermoplastic organic polymer containing a conventional flame retardant and a hydroxylamine ester, in particular a tetraalkyl piperidine hydroxylamine ester. WO 03/087211 A2

### Flame Retardant Polymer Compositions Containing Hydroxylamine Esters

The instant invention pertains to a thermoplastic organic polymer containing a conventional flame retardant and a hydroxylamine ester, in particular a tetraalkyl piperidine hydroxylamine ester. Further aspects of the invention are the use of hydroxylamine esters as flame retardants and a process for improving flame retardancy of a thermoplastic organic polymer.

United States Patent No. 5,393,812 describes polyolefin compositions which are made flame retardant by addition of a halogenated hydrocarbyl phosphate or phosphonate ester flame retardant and stabilized against degradation by UV-light with an alkoxyamine functional hindered amine. EP-A-792911 proposes the use of an alkoxyamine functional hindered amine for improving the flame retardant properties of a polyolefin. The activity of alkoxyamine functional hindered amines alone as flame retardants is disclosed in WO 99/00450. There is, however, no disclosure in the prior art suggesting hydroxylamine esters as flame retardants together with a conventional flame retardant.

The instant hydroxylamine esters, for example, provide a synergist system for heavy metals (e.g. antimony oxide replacement in ABS). Good flame retardancy can be achieved by using less classic flame retardant agent in the presence of the instant hydroxylamine esters.

Accordingly the instant invention provides a flame retardant composition which comprises

- (a) a thermoplastic polymeric substrate,
- (b) a mixture of
  - (i) a hydroxylamine ester having a structural element of formula (I) or formula (I') or a polymeric hydroxylamine ester having a repetitive structural unit of formula (II) or (II')

The aliphatic dicarboxylic acids can contain 2 to 40 carbon atoms, the cycloaliphatic dicarboxylic acids 6 to 10 carbon atoms, the aromatic dicarboxylic acids 8 to 14 carbon atoms, the aliphatic hydroxycarboxylic acids 2 to 12 carbon atoms and the aromatic and cycloaliphatic hydroxycarboxylic acids 7 to 14 carbon atoms.

When further diols are used these may be aliphatic, cycloaliphatic or aromatic diols.

The aliphatic diols can contain 2 to 12 carbon atoms, the cycloaliphatic diol 5 to 8 carbon atoms and the aromatic diols 6 to 16 carbon atoms.

While the polymeric substrate can be any of a wide variety of polymeric types including polyolefins, polystyrenics, polyesters, polyamides, polyurethanes, and PVC, the polymer substrate is preferably selected from the group of resins consisting of the polyolefins, the thermoplastic olefins, styrenic polymers and copolymers and blends or mixtures thereof.

Particularly preferred is polypropylene, polyethylene, thermoplastic olefin (TPO), polystyrene, ABS, high impact polystyrene, expandable polystyrene (EPS) and extrusion foamed polystyrene.

The physical form of the polymeric substrates can be of a wide variety including films, fibers, injection molded parts, extrusion articles, blow molded articles, particle foams, extrusion foams, injection molded foams.

Particularly preferred are foamed articles from polymers based on styrene, ethylene, propylene and EPDM.

Most preferred are compositions of EPS (expandable polystyrene), where the additives can be added in each step between start of styrene polymerization and foaming the EPS beads. Another preferred embodiment is XPS (extrusion foamed polystyrene), where the additives can be added during each step of melt processing and foaming the polystyrene.

Foams can be in general produced by blowing polymer beads or by extrusion or injection molding using chemical or physical blowing agents. Polystyrene based foams are mostly produced by foaming expandable polystyrene (EPS), typically at around 120°C, or by melt extrusion of polystyrene, typically at a temperature above 180°C, together with a physical or chemical blowing agent (extrusion foamed polystyrene = XPS).

Expandable polystyrene (EPS) is produced in suspension polymerization of styrene adding for example pentane as physical blowing agent. To achieve flame retardancy, brominated flame-retardants (e.g. hexabromocyclododecane) and optionally peroxides as fire retardant synergists (e.g. dicumyl peroxide) are added during styrene suspension polymerization (see for example WO 98/51735 or US 4,272,583 and references cited therein). These fire retardant synergists (peroxides) decompose at temperature above 140°C and lose their flame retardant activity. Therefore, it is not possible to use them in foam extrusion processes (XPS) because processing temperatures are commonly above the peroxides' decomposition temperatures.

As the herein disclosed new systems can be melt processed without decomposition, flame retardant synergism can be realized in foam extrusion processes, as well.

The conventional flame retardant component (ii) is preferably selected from the group consisting of

A further aspect of the invention is a method of making a thermoplastic polymer flame retarding by incorporating into the thermoplastic polymer

a mixture of

- (i) a hydroxylamine ester having a structural element of formula (I) or formula (I') or with a polymeric hydroxylamine ester having a repetitive structural unit of formula (II) or (II')

wherein

X is hydrogen, C<sub>1</sub>-C<sub>36</sub>alkyl, C<sub>2</sub>-C<sub>36</sub>alkenyl, C<sub>2</sub>-C<sub>18</sub>alkinyl, C<sub>6</sub>-C<sub>10</sub>aryl, -O-C<sub>1</sub>-C<sub>18</sub>alkyl, -O-C<sub>6</sub>-C<sub>10</sub>aryl, -NH-C<sub>1</sub>-C<sub>18</sub>alkyl, -NH-C<sub>6</sub>-C<sub>10</sub>aryl, -N(C<sub>1</sub>-C<sub>6</sub>alkyl)<sub>2</sub>;

X' is a direct bond or C<sub>1</sub>-C<sub>36</sub>alkylene, C<sub>2</sub>-C<sub>36</sub>alkenylene, C<sub>2</sub>-C<sub>36</sub>alkinylene, -(C<sub>1</sub>-C<sub>6</sub>alkylene)-phenylene-(C<sub>1</sub>-C<sub>6</sub>alkylene)- or a group from a dimer acid;

G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub> and G<sub>4</sub> are independently alkyl of 1 to 4 carbon atoms, or G<sub>1</sub> and G<sub>2</sub> together and G<sub>3</sub> and G<sub>4</sub> together, or G<sub>1</sub> and G<sub>2</sub> together or G<sub>3</sub> and G<sub>4</sub> together are pentamethylene;

G<sub>5</sub> and G<sub>6</sub> are independently hydrogen or C<sub>1</sub>-C<sub>4</sub> alkyl;

R<sub>1</sub> is C<sub>1</sub>-C<sub>12</sub>alkyl, C<sub>5</sub>-C<sub>7</sub>cycloalkyl, C<sub>7</sub>-C<sub>8</sub>aralkyl, C<sub>2</sub>-C<sub>18</sub>alkanoyl, C<sub>3</sub>-C<sub>5</sub>alkenoyl or benzoyl; and

(ii) a flame retardant compound selected from the group consisting of halogenated, phosphorus, boron, silicon and antimony compounds, metal hydroxides, metal hydrates, metal oxides and mixtures thereof.

The definitions and preferences given above apply also to the method.

The additives of the invention and optional further components may be added to the polymer material individually or mixed with one another. If desired, the individual components can be mixed with one another before incorporation into the polymer for example by dry blending, compaction or in the melt.

The incorporation of the additives of the invention and optional further components into the polymer is carried out by known methods such as dry blending in the form of a powder, or wet mixing in the form of solutions, dispersions or suspensions for example in an inert solvent, water or oil. The additives of the invention and optional further additives may be incorporated, for example, before or after molding or also by applying the dissolved or dispersed additive or additive mixture to the polymer material, with or without subsequent evaporation of the solvent or the suspension/dispersion agent. They may be added directly into the processing apparatus (e.g. extruders, internal mixers, etc), e.g. as a dry mixture or powder or as solution or dispersion or suspension or melt.

The incorporation can be carried out in any heatable container equipped with a stirrer, e.g. in a closed apparatus such as a kneader, mixer or stirred vessel. The incorporation is preferably carried out in an extruder or in a kneader. It is immaterial whether processing takes place in an inert atmosphere or in the presence of oxygen.

The addition of the additive or additive blend to the polymer can be carried out in all customary mixing machines in which the polymer is melted and mixed with the additives. Suitable machines are known to those skilled in the art. They are predominantly mixers, kneaders and extruders.

The process is preferably carried out in an extruder by introducing the additive during processing.

Particularly preferred processing machines are single-screw extruders, contrarotating and corotating twin-screw extruders, planetary-gear extruders, ring extruders or cokneaders. It is

also possible to use processing machines provided with at least one gas removal compartment to which a vacuum can be applied.

Suitable extruders and kneaders are described, for example, in *Handbuch der Kunststoffextrusion, Vol. 1 Grundlagen, Editors F. Hensen, W. Knappe, H. Potente, 1989, pp. 3-7, ISBN:3-446-14339-4 (Vol. 2 Extrusionsanlagen 1986, ISBN 3-446-14329-7).*

For example, the screw length is 1 - 60 screw diameters, preferably 35-48 screw diameters. The rotational speed of the screw is preferably 10 - 600 rotations per minute (rpm), very particularly preferably 25 - 300 rpm.

The maximum throughput is dependent on the screw diameter, the rotational speed and the driving force. The process of the present invention can also be carried out at a level lower than maximum throughput by varying the parameters mentioned or employing weighing machines delivering dosage amounts.

If a plurality of components is added, these can be premixed or added individually.

The additives of the invention and optional further additives can also be sprayed onto the polymer material. They are able to dilute other additives (for example the conventional additives indicated above) or their melts so that they can be sprayed also together with these additives onto the material. Addition by spraying during the deactivation of the polymerization catalysts is particularly advantageous; in this case, the steam evolved may be used for deactivation of the catalyst. In the case of spherically polymerized polyolefins it may, for example, be advantageous to apply the additives of the invention, optionally together with other additives, by spraying.

The additives of the invention and optional further additives can also be added to the polymer in the form of a masterbatch ("concentrate") which contains the components in a concentration of, for example, about 1 % to about 40% and preferably 2 % to about 20 % by weight incorporated in a polymer. The polymer must not be necessarily of the identical structure as the polymer where the additives are added finally. In such operations, the polymer can be used in the form of a powder, granules, solutions, suspensions or in the form of latices.

Incorporation can take place prior to or during the shaping operation, or by applying the dissolved or dispersed compound to the polymer, with or without subsequent evaporation of the solvent. In the case of elastomers, these can also be stabilized as latices. A further

possibility for incorporating the additives of the invention into polymers is to add them before, during or directly after the polymerization of the corresponding monomers or prior to crosslinking. In this context the additive of the invention can be added as it is or else in encapsulated form (for example in waxes, oils or polymers).

The materials containing the additives of the invention described herein can be used for the production of moldings, rotomolded articles, injection molded articles, blow molded articles, films, tapes, mono-filaments, fibers, nonwovens, profiles, adhesives or putties, surface coatings and the like.

Yet a further aspect of the invention is a flame retardant mixture comprising

- (i) a hydroxylamine ester having a structural element of formula (I) or formula (I') or with a polymeric hydroxylamine ester having a repetitive structural unit of formula (II) or (II')

wherein

X is hydrogen, C<sub>1</sub>-C<sub>36</sub>alkyl, C<sub>2</sub>-C<sub>36</sub>alkenyl, C<sub>2</sub>-C<sub>18</sub>alkinyl, C<sub>6</sub>-C<sub>10</sub>aryl, -O-C<sub>1</sub>-C<sub>18</sub>alkyl, -O-C<sub>6</sub>-C<sub>10</sub>aryl, -NH-C<sub>1</sub>-C<sub>18</sub>alkyl, -NH-C<sub>6</sub>-C<sub>10</sub>aryl, -N(C<sub>1</sub>-C<sub>6</sub>alkyl)<sub>2</sub> ;

X' is a direct bond or C<sub>1</sub>-C<sub>36</sub>alkylene, C<sub>2</sub>-C<sub>36</sub>alkenylene, C<sub>2</sub>-C<sub>36</sub>alkinylene, -(C<sub>1</sub>-C<sub>6</sub>alkylene)-phenylene-(C<sub>1</sub>-C<sub>6</sub>alkylene)- or a group from a dimer acid;

G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub> and G<sub>4</sub> are independently alkyl of 1 to 4 carbon atoms, or G<sub>1</sub> and G<sub>2</sub> together and G<sub>3</sub> and G<sub>4</sub> together, or G<sub>1</sub> and G<sub>2</sub> together or G<sub>3</sub> and G<sub>4</sub> together are pentamethylene;

G<sub>5</sub> and G<sub>6</sub> are independently hydrogen or C<sub>1</sub>-C<sub>4</sub> alkyl;

R<sub>1</sub> is C<sub>1</sub>-C<sub>12</sub>alkyl, C<sub>5</sub>-C<sub>7</sub>cycloalkyl, C<sub>7</sub>-C<sub>8</sub>aralkyl, C<sub>2</sub>-C<sub>18</sub>alkanoyl, C<sub>3</sub>-C<sub>5</sub>alkenoyl or benzoyl; and

(ii) a flame retardant compound selected from the group consisting of halogenated, phosphorus, boron, silicon and antimony compounds, metal hydroxides, metal hydrates, metal oxides and mixtures thereof.

The use of a synergistic mixture as defined above as flame retarding additive for thermoplastic polymer articles and the use of a hydroxylaminester itself as flame retarding additive for thermoplastic polymer articles are further aspects of the invention.

All definitions and preferences given above apply also to these aspects of the invention.
